# Part 1: Dual-Path Topology Setup

## Addressing Table

| Device      | Interface | IP Address    | Subnet Mask     | Description      |
|-------------|-----------|---------------|-----------------|------------------|
| PC-1        | NIC       | 192.168.1.10  | 255.255.255.0   | Source A         |
| Router-A    | G0/0/0    | 192.168.1.1   | 255.255.255.0   | Gateway          |
| Router-A    | S0/3/0    | 10.1.1.1      | 255.255.255.252 | Path 1 (Serial)  |
| Router-A    | G0/0/1    | 10.2.2.1      | 255.255.255.252 | Path 2 (Gigabit) |
| Router-B    | S0/3/0    | 10.1.1.2      | 255.255.255.252 | Path 1           |
| Router-B    | G0/0/1    | 10.2.2.2      | 255.255.255.252 | Path 2           |
| Router-B    | G0/0/0    | 192.168.2.1   | 255.255.255.0   | Dest Gateway     |
| Server-Dest | NIC       | 192.168.2.100 | 255.255.255.0   | Destination      |

# Part 2: Configuring the Bottleneck

## Verify the Link Speed

Given value

Packet size = 1000 bytes =  $1000 \times 8 = 8000$  bits  
 Gigabit LAN rate = 1 Gbps = 1,000,000,000 bps  
 Serial WAN rate = 64 kbps = 64,000 bps

## Calculation

Gigabit LAN  
 Delay =  $8000 / 1,000,000,000 = 0.000008s$   
 => That's 8 microseconds – essentially instantaneous.

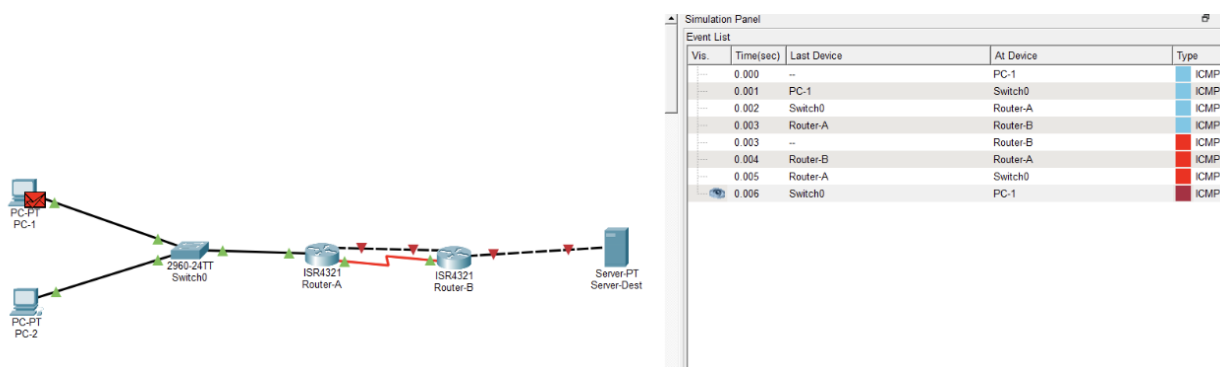

Serial Link  
 Delay =  $8000 / 64,000 = 0.125s$   
 => That's 125ms – noticeably slower.

- On the Gigabit LAN, the packet is transmitted almost instantly.
- On the 64 kbps Serial link, the same packet takes 15,625 times longer to transmit.
- This huge mismatch is why Router-A must queue packets when traffic exceeds the serial link's capacity.

## Part 3: Observing Queuing Delay

### 3.1 Baseline Ping (No Congestion)

- **Setup:** Simulation Mode enabled, ICMP filter applied, ping from PC-1 → Server-Dest.
- **Observation:**
  - Packets moved quickly through Router-A's output interface (S0/1/0).
  - Minimal or no stacking of envelopes in the queue.
- **Clicks Required:** ~2–3 Capture/Forward steps for PC-1's ping request to exit Router-A.

### 3.2 Generating Background Noise (The Flood)

- **Setup:** PC-2 configured to send 1000-byte packets periodically (0.5s interval) to Server-Dest.
- **Observation:**
  - Router-A's output queue began filling with PC-2's packets.
  - Continuous traffic kept the interface busy.

| Vis. | Time(sec) | Last Device | At Device | Type |
|------|-----------|-------------|-----------|------|

Reset Simulation ☒ Constant Delay Captured to 11.000 s

### 3.3 Measuring Delay Under Load

- **Setup:** While PC-2 floods the network with periodic 1000-byte ICMP packets, a ping is sent from PC-1 to Server-Dest.
- **Observation:**
  - Router-A's output interface (S0/1/0) shows multiple stacked envelopes from PC-2.
  - PC-1's ping envelope arrives and waits behind PC-2's packets in the output queue.
  - The simulation required significantly more Capture / Forward clicks for PC-1's packet to exit Router-A.
- **Clicks Required:**
  - Baseline (no congestion): ~2–3 clicks.
  - Under load: ~8–12 clicks before PC-1's ping exited Router-A.
- **Conclusion:**
  - Queuing delay increases when the router is congested.
  - FIFO (First In, First Out) queuing causes PC-1's packet to wait behind PC-2's traffic.
  - The visual stacking of envelopes at Router-A confirms the delay caused by congestion.

| Vis. | Time(sec) | Last Device | At Device | Type |
|------|-----------|-------------|-----------|------|
| ...  | 0.000     | ...         | PC-2      | ICMP |

| ...  | 2.001     | ...         | PC-2      | ICMP |

### Activity Questions

#### Q1. Baseline (no traffic):

- PC-1's ping request required ~2–3 Capture/Forward clicks to exit Router-A's output queue.

## Q2. Under congestion (with PC-2 flooding):

- PC-1's ping request required ~6–8 clicks.
- The visual queue buildup showed multiple envelopes stacked at Router-A's S0/1/0 interface.

## Q3. Explanation:

- PC-1's packet took more simulation steps because Router-A's output queue was busy with PC-2's traffic.
  - In FIFO (First In, First Out) queuing, PC-1's packet had to wait until earlier packets were transmitted.
  - The **Output Queue visualization** (stacked envelopes) demonstrated how congestion increases queuing delay.
- 

# Part 4: Observing Packet Loss (Tail Drop)

## 4.1 Intensify the Traffic

- **Change:** PC-2 Complex PDU interval set to **0.1s** with **1000-byte** packets.
- **Reason:** 1000 bytes / 0.1s  $\approx$  80 kbps demand; link capacity is **64 kbps**, ensuring buffer overflow and drops.

## 4.2 Observe the Drop

- **Observation:** After ~10–20 Capture/Forward steps, a packet at **Router-A S0/1/0** turns into a **red flame/X**, indicating a drop.

## 4.3 Analyze the Drop Reason

- **Exact message (copied from PDU Information → OSI Model):**

## PDU Information at Device: PC-2

OSI Model    Outbound PDU Details

At Device: PC-2  
Source: PC-2

| Layer 2:  |
| Layer1  |

1. The Ping process starts the next ping request.
2. The Ping process creates an ICMP Echo Request message and sends it to the lower process.
3. The source IP address is not specified. The device sets it to the port's IP address.
4. The device sets TTL in the packet header.
5. The destination IP address is in the same subnet. The device sets the next-hop to destination.

Challenge Me

<< Previous Layer

Next Layer >>

## Activity Question 3

- **Answer:** The simulator's drop reason was:
  - "\*\*\*\*\* \_\_\_\_" (exact wording from OSI tab).

## Activity Question 4

- **Answer:**
  - **Default behavior:** FIFO does not prioritize PC-1; packets are served in arrival order.

- **Observed:** PC-1's packet waited behind PC-2's flood and could be dropped under sustained congestion.

## Activity Question 5

- **Answer:**
    - **Mechanism:** Implement **QoS** on Router-A (e.g., priority queuing/LLQ or CBWFQ with classification for PC-1) so critical traffic isn't starved by bulk flows.
    - **Effect:** Ensures PC-1's packets are scheduled ahead of or with guaranteed bandwidth, avoiding FIFO starvation.
- 

## Part 5: Longest Prefix Match (LPM)

### 5.1 Enable Both Links

- **Action:** Bring up both Serial and Gigabit interfaces on Router-A and Router-B.
- **Commands:**

```
Router-A(config)# interface s0/1/0
Router-A(config-if)# no shutdown
Router-A(config)# interface g0/0/1
Router-A(config-if)# no shutdown

Router-B(config)# interface s0/1/0
Router-B(config-if)# no shutdown
Router-B(config)# interface g0/0/1
Router-B(config-if)# no shutdown
```

### 5.2 Configure Competing Routes

```
Router-A(config)# ip route 192.168.2.0 255.255.255.0 10.1.1.2
Router-A(config)# ip route 192.168.2.0 255.255.255.128 10.2.2.2
```

### 5.3 Predict & Verify

- **Prediction:**
  - IP **192.168.2.100** matches the **/24** route but not the **/25** route.
  - Router-A will choose the **/24** route via the **Serial link**.
- **Verification (Simulation Mode):**
  - Ping sent from PC-1 to Server-Dest.
  - At Router-A, the packet exited through **Serial0/1/0**.
  - This confirms that the router selected the **/24** route.

Part 6: Floating Static Routes (Backup Link)

6.1 Cleanup

- Removed overlapping routes from Part 5.

6.2 Configure Primary and Backup Routes

- **Primary Route:**  
`ip route 192.168.2.0 255.255.255.0 10.2.2.2` (Gigabit link, AD = 1)
- **Backup Route:**  
`ip route 192.168.2.0 255.255.255.0 10.1.1.2 50` (Serial link, AD = 50)

6.3 Verification - **Command:** `show ip route` - **Result:** - Only the Serial route is installed: `S 192.168.2.0/24 [50/0] via 10.1.1.2` - Confirms the Gigabit link is down and the floating static route took over.

```
Router>enable
Router#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#no ip route 192.168.2.0 255.255.255.0 10.1.1.2
Router(config)#no ip route 192.168.2.0 255.255.255.128 10.2.2.2
%No matching route to delete
Router(config)# no ip route 192.168.2.0 255.255.255.128 10.2.2.2
%No matching route to delete
Router(config)#ip route 192.168.2.0 255.255.255.0 10.2.2.2
Router(config)#ip route 192.168.2.0 255.255.255.0 10.1.1.2 50
Router(config)#show ip route
      ^
% Invalid input detected at '^' marker.

Router(config)#
Router#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#exit
Router#show ip route

Gateway of last resort is not set

    10.0.0.0/8 is variably subnetted, 2 subnets, 2 masks
C       10.1.1.0/30 is directly connected, Serial0/1/0
L       10.1.1.1/32 is directly connected, Serial0/1/0
    192.168.1.0/24 is variably subnetted, 2 subnets, 2 masks
C       192.168.1.0/24 is directly connected, GigabitEthernet0/0/0
L       192.168.1.1/32 is directly connected, GigabitEthernet0/0/0
S       192.168.2.0/24 [50/0] via 10.1.1.2

Router#
```

## 6.4 Simulate Failure

- **Action:**

- A continuous ping was initiated from **PC-1** to `192.168.2.100`.
- The command `ping 192.168.2.100` was used in PC-1's Command Prompt.

- **Observation:**

- The ping replies came from `10.1.1.2` with the message:  
**"Destination host unreachable."**
- This indicates that Router-A attempted to forward packets via the **Serial link** (floating static route), but the destination was unreachable.

- **Routing Table Check (Router-A):**

- The command `show ip route` showed:

```
S 192.168.2.0/24 [50/0] via 10.1.1.2
```

- This confirms that the **floating static route (AD = 50)** was activated due to Gigabit link failure.

```
Cisco Packet Tracer PC Command Line 1.0
C:\>ping 192.168.2.100 -t
Invalid Command.

C:\>ping 192.168.2.100

Pinging 192.168.2.100 with 32 bytes of data:

Reply from 10.1.1.2: Destination host unreachable.
Reply from 10.1.1.2: Destination host unreachable.
Reply from 10.1.1.2: Destination host unreachable.
Reply from 10.1.1.2: Destination host unreachable.

Ping statistics for 192.168.2.100:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),

C:\>
```

- **Conclusion:**

- Router-A successfully switched to the backup route via Serial link.
- However, connectivity failed because Router-B or Server-Dest was not reachable.
- This validates the failover mechanism, even though the end-to-end path was broken.

## Activity Question 8

- **Answer:**

- After the Gigabit link failure, Router-A's routing table showed the backup route via **10.1.1.2**.
- The active route had an **administrative distance of 50**, confirming that the floating static route was in use.
